

The Ultimate Secondary School Gadget

This week you are going to design the **ultimate** gadget for secondary school and record your very own advertisement.

You can design gadget to do **anything** and **everything** you choose, so get thinking!

Let's look at a description of another gadget first though...

Today, we would like you to read the description of the spy gadget below - the Radio Mouth Brace 365.

We would like to know:

- What does it do? What technical language has been used? Why? What persuasive techniques have been put in to keep you reading?
- What different organisational features can you find?

When you have answered these questions, start jotting down any ideas you might have, ready for tomorrow's planning session!

How the Radio Mouth Brace 365 works

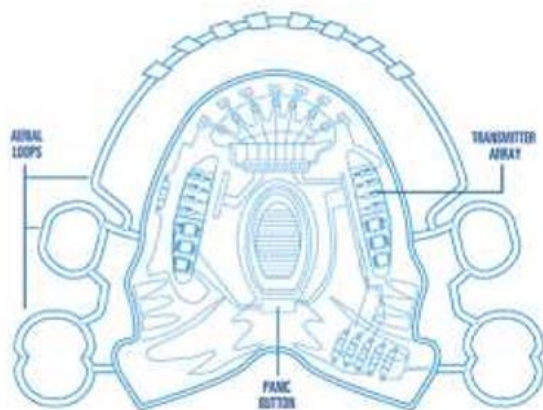

Are you tired of being caught trying to listen to conversations? Are you in need of a gadget that will help you to hide whilst listening in to others? Then look no further, the latest in pioneering spy technology is here. This easy-to-use device will solve all of your espionage problems. Designed with safety in mind, the device also features a panic button that will enable a quick and speedy escape from precarious situations- vital for any spy. Read on to find out how it works.

How it Works

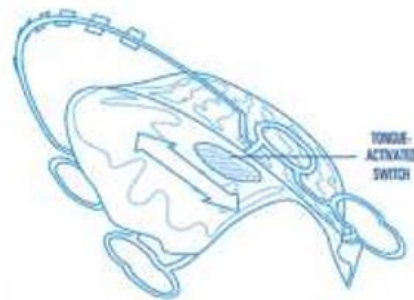

Designed by a team of specialist scientists, in conjunction with active agents the brace runs off the Ergo300 system of technology- 100% reliable. It has been produced with subtle and easy to use operational devices which trigger commands and send messages via the transmitter arrays. Below we have outlined how each function works.

RADIO MOUTH BRACE

PLAN VIEW

PERSPECTIVE VIEW

Recording Device

One of the valuable functions that the radio mouth brace offers is a hidden recording device. The miniscule microphone is undetectable to the human eye yet contains as much technology as full-sized computer. This allows it to detect and record sounds up to 200 metres away, as a result, you can stay hidden and elusive whilst still getting your job done. To activate the microphone (Micro 3000), simply tap the front of the brace 3 times with your tongue; you will know the device is recording when you feel a small vibration reverberate around your mouth.

Camera

Another incredible feature of the mouth brace is a mega pixel camera. Designed by cutting edge scientists, the camera blends in with the metal on the brace and simply appears as one of the links. In order to initialise the camera, use your tongue to slide an easy-to-reach switch, located on the inside of the brace (on the right-hand side). You will know this has worked at a short click- detectable only to you- will alert you that it is ready to operate. To take your photo, smile (this will allow the lens to see) and look in the direction of your intended shot. Using shutter speed technology, the photo takes seconds. So that you can be sure it has taken, a second sound -much like the click of a camera lens- will notify you. If you wanted to print copies of the photo, this can be done when you plug the braces in to a computer.

As you can see, this gadget is a vital tool in any accomplished spy's toolkit. It's simple, covert design makes its real functions so elusive that it will never be detected. Designed with safety, efficiency and practicality in mind, it will not disappoint. For more information, please seek advice from the designs team.
